

Today's modern facilities, both commercial and industrial buildings, utilize a complex network of interfacing devices including lighting controls, energy monitors, security, fire protection, personnel safety systems, boiler controls, HVAC and more. Sierra Monitor's FieldServer Technologies division's gateways are the most popular gateway in the industry to enable the interoperability necessary to interface these varied devices to the building automation control system.

Sierra Monitor's gas detection systems include a full range of area monitors to detect hazardous gases such as carbon monoxide, combustible gas and oxygen deficiency before they reach dangerous levels. The data communications capabilities of these hazardous gas detection systems enable them to easily interface to building automation and central control systems.

Sierra Monitor's Telecom Facilities Controllers are compact controllers for HVAC, security, and safety monitoring in remote telecommunications enclosures.
